MATH 611 (DUE 10/2)

HIDENORI SHINOHARA

Exercise. (Problem 10, Chapter 1.3) Find all the connected 2-sheeted and 3-sheeted covering spaces of $S^1 \vee S^1$, up to isomorphisms of covering spaces without base points.

Proof. Let $X = S^1 \vee S^1$. By the discussion on P.70 of the textbook, we know that n-sheeted covering spaces of X are classified by equivalence classes of homomorphisms $\pi_1(X, x_0) \to S_n$. Let a, b denote paths in X as in Figure 1. We can identify each homomorphism ϕ by checking what ϕ maps a and b to. (Strictly speaking, $\pi_1(X, x_0)$ is generated by $[a], [b]$, but we will abuse notations by writing a and b instead of $[a], [b]$.)

The following are all the cases. Figure 2 shows the corresponding graphs.

- Case 1: $\phi_1(a) = \phi_1(b) = (1)$. The space that corresponds to this homomorphism is disconnected.
- Case 2: $\phi_2(a) = (12), \phi_2(b) = (1)$. This generates a connected covering space.
- Case 3: $\phi_3(a) = (1), \phi_3(b) = (12)$. This case is equivalent to Case 2 by symmetry.
- Case 4: $\phi_4(a) = (12), \phi_4(b) = (12)$. This generates a connected covering space.

ϕ_2 and ϕ_4 are not conjugates of each other because for any permutation σ, $b \mapsto \sigma\phi_2(b)\sigma^{-1} = \sigma(1)\sigma^{-1} = (1) \neq \phi_4(b)$. Thus the graphs corresponding to Case 2 and Case 4 in Figure 2 are all the 2-sheeted covering spaces of X.

Do the case of 3.

Exercise. (Problem 11, Chapter 1.3) Construct finite graphs X_1 and X_2 having a common finite-sheeted covering space $\tilde{X}_1 = \tilde{X}_2$, but such that there is no space having both X_1 and X_2 as covering spaces.

Proof. Figure 3 shows X_1, X_2 and $\tilde{X}_1 = \tilde{X}_2$.

We claim that there exists no space having both X_1 and X_2 as covering spaces. On the contrary, suppose there exists such a space X with covering maps $p_1 : X_1 \to X, p_2 : X_2 \to X$. Then every point in X must have a neighborhood that homeomorphic to an open subset of X_1. Since X_1 is a graph, that means X is locally a line and a vertex with edges. In other words, X must be a graph.

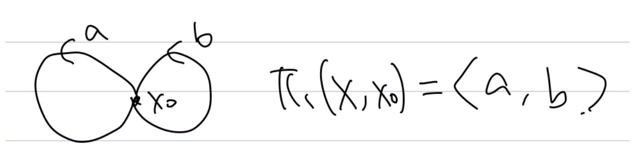

FIGURE 1. Problem 10 ($X = S^1 \vee S^1$)

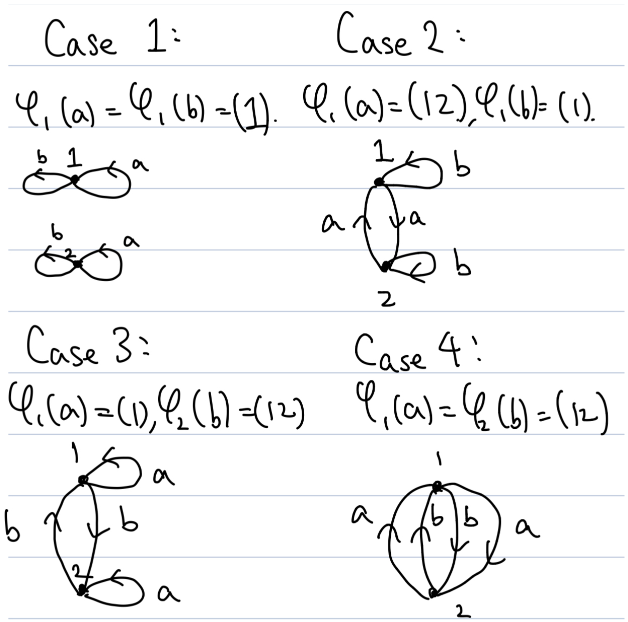

FIGURE 2. Problem 10 (2-sheeted covers)

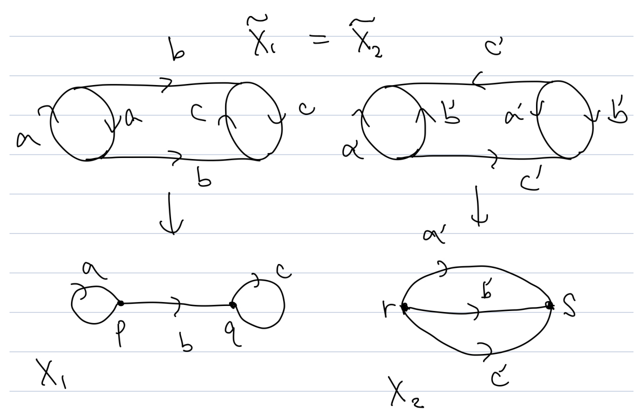

FIGURE 3. Problem 11

There must exist a neighborhood of $p_1(p)$ and a neighborhood of p such that they are homeomorphic. Since p is a vertex of degree 3, $p_1(p)$ must be a vertex of degree 3 as well. Similarly, $p_1(q)$ must be a vertex of degree 3 as well.

Since p, q are the only vertices of X_1, X contains at most two vertices and their degrees must be 3. Since the sum of degrees of all vertices must be even from elementary graph theory, X must contain two vertices of degree 3.

If X only consists of loops, then the degree of each vertex will be even. Thus the two vertices must be joined by at least one edge. Then if one vertex has a loop, the other must have a loop as well in order to have degree 3. If there exists another edge joining the two vertices, there must be a third one in order for the two vertices to have degree 3. Therefore, X_1, X_2 are the only graphs with two vertices of degree 3.

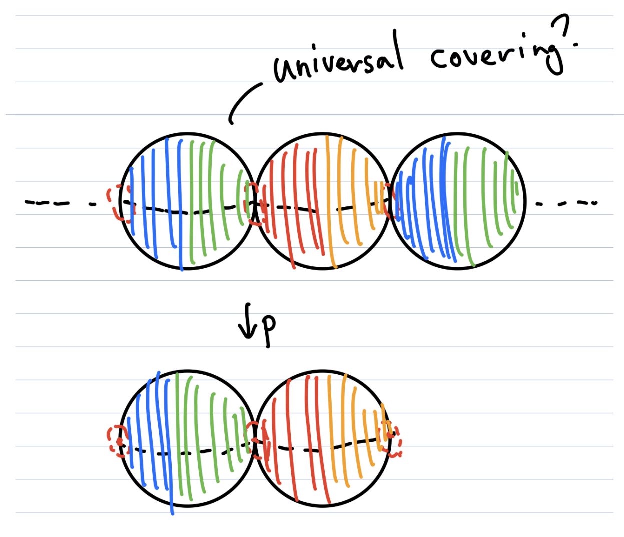

FIGURE 4. Problem 14 Idea 2

Suppose that X_1 is a covering space of X_2 with a covering map $f : X_1 \to X_2$. Without loss of generality, $f(p) = r, f(q) = s$. Consider the path a' in X_2. Lifting a' to X_1 will result in a path from p to q. This implies that f maps points on the path b into points on a path a'.

Now consider the path b' in X_2. Lifting b' to X_1 will again result in a path from p to q. This implies that f maps points on the path b into points on a path b'.

This implies that every point on the path b must be mapped to r or s. This is a contradiction because f is continuous and $\{b(t) \mid t \in [0, 1]\}$ is connected, but $\{r, s\}$ is disconnected.

Thus X_1 is not a covering space of X_2.

Similarly, suppose that X_2 is a covering space of X_1 with a covering map $g : X_2 \to X_1$. Without loss of generality, $g(r) = p, g(s) = q$. This implies $g^{-1}(p) = \{r\}$, so the number of sheets is 1. In other words, g is injective. Consider the path a in X_1. Lifting a to X_2 results into a loop based at r. Since $a : I \to X_1$ is injective, $\tilde{a} : I \to X_2$ is injective since $g \circ \tilde{a} = a$. Then $\tilde{a}(t) = s$ for some $t \in [0, 1]$, so $a(t) = g(\tilde{a}(t)) = g(s) = q$. However, q is not a point on a. This is a contradiction, so X_2 is not a covering space of X_1.

Hence, there exists no space that has both X_1 and X_2 as covering spaces. $\square$

Exercise. (Problem 14, Chapter 1.3) Find all the connected covering spaces of $\mathbb{R}P^2 \vee \mathbb{R}P^2$.

Proof. I think Figure 4 is the universal covering of $\mathbb{P}_2 \wedge \mathbb{P}_2$, but I'm not certain.
