Galois Theory VI

1. THE THEOREM ON SYMMETRIC POLYNOMIALS

Exercise. (Problem 1) By substituting $u_4 = 0$, we get $u_1^2 u_2 u_3 + u_1 u_2^2 u_3 + u_1 u_2 u_3^2 = s_3 s_1$. s_3s_1 with 4 variables expands to $u_1^2u_2u_3 + u_1^2u_2u_4 + u_1^2u_3u_4 + u_1u_2^2u_3 + u_1u_2^2u_4 + u_1u_2u_3^2 + 4u_1u_2u_3u_4 + u_1u_2u_4^2 + u_1u_3^2u_4 + u_1u_3u_4^2 + u_2^2u_3u_4 + u_2u_3^2u_4 + u_2u_3u_4^2$. Then $s_3s_1 - f$ where fis the original polynomial gives us $4u_1u_2u_3u_4 = 4s_4$. Therefore, $f = s_3s_1 - 4s_4$.

Exercise. (Problem 2) We are given that $|M - xI| = x^3 - ax^2 + bx - c$. This implies that $|M-(-x)I|=-x^3-ax^2-bx-c$. Since the determinant function preserves multiplication, $|M-xI||M-(-x)I| = |M^2-x^2I|$. This implies $|M^2-x^2I| = -x^6 + (a^2-2b)x^4 + (b^2+1)x^4 + (b$ $(2ac)x^2+c^2$. Therefore, the characteristic polynomial of M is $-x^3+(a^2-2b)x^2+(b^2+2ac)x+c^2$.

2. Galois Theory VI

Exercise. (Problem 3)

- (a) $\{(123), (132), e\}$ is clearly a subgroup of the stabilizer group S_v of v. Since $(12) \notin S_v$, $3 \leq |S_v| \leq 5$. By Lagrange's Theorem, $S_v = \langle (123) \rangle$.
- (b) By (i), S_3v contains only $[S_3:S_v]=2$ elements. Thus $v'=(12)\cdot v=u_2u_1^2+u_1u_3^2+u_2u_3^2+u_3^2+u_3^2+u_3^2+u_3^2+u_3^2+u_3^2+u_3^2+u_3^2+u_3^2+u_3^2+u_3^2+u_3^2+u_3^2+u_3$ $u_3u_2^2$.
- (c) By substituting $u_3 = 0$ for v + v', we get $u_1 u_2^2 + u_2 u_1^2 = s_1 s_2$. Then $v + v' s_1 s_2 = s_1 s_2$. $-3u_1u_2u_3 = -3s_3$. Therefore, $v + v' = s_1s_2 + 3s_3$.
- (d) We will use the fundamental theorem of Galois Theory. $F(v) = K^{\langle (123) \rangle}$, so $|\langle (123) \rangle| =$ 3 = [K: F(v)]. Moreover, $|\langle \operatorname{Gal}(K/F) \rangle| = [K: F]$. Therefore, [F(v): F] = [K: F] $F/[K:F(v)] = |\langle \operatorname{Gal}(K/F)\rangle|/3.$
- (e) Calculation shows that $vv' = 9s_3^2 + s_3s_1^3 6s_3s_1s_2 + s_2^3$. By substituting $s_1 = 0, s_2 =$ $p, s_3 = q$, we get $9q^2 + p^3$.

Exercise. (Problem 4)

(a) The discriminant can be expressed as $-4s_1^3s_3 + s_1^2s_2^2 + 18s_1s_2s_3 - 4s_2^3 - 27s_3^2$. By substituting $s_1 = 1, s_2 = -2, s_3 = -1$, we get 49.

from sympy.polys.polyfuncs import symmetrize from sympy import *

```
u1, u2, u3 = symbols('u1_u2_u3')

u = [u1, u2, u3]

discriminant = 1
for i in range(3):
    for j in range(i + 1, 3):
        discriminant *= (u[i] - u[j]) * (u[i] - u[j])

print(latex(symmetrize(discriminant, formal = True)[0]))
```
