## MATH 601 HOMEWORK (DUE 9/11)

## HIDENORI SHINOHARA

**Exercise.** (1) Show that  $2 \times 2$  matrices give a functor,  $M_2$ , from the category of rings to itself,  $R \mapsto M_2(R)$ .

*Proof.* Let R, R' be rings and  $\phi \in \text{Hom}(R, R')$ . Let  $M_2(\phi) : M_2(R) \to M_2(R')$  be defined such that

$$(M_2(\phi))$$
  $\begin{pmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix} \end{pmatrix} = \begin{bmatrix} \phi(a) & \phi(b) \\ \phi(c) & \phi(d) \end{bmatrix}$ .

We claim that  $M_2$  is indeed a functor.

• Claim 1: For any  $\phi \in \text{Hom}(R, R')$ ,  $M_2(\phi) \in \text{Hom}(M_2(R), M_2(R'))$ . In other words, we want to show that  $M_2(\phi)$  is a ring homomorphism for any  $\phi$ .

$$(M_{2}(\phi)) \left( \begin{bmatrix} a & b \\ c & d \end{bmatrix} + \begin{bmatrix} e & f \\ g & h \end{bmatrix} \right) = (M_{2}(\phi)) \left( \begin{bmatrix} a+e & b+f \\ c+g & d+h \end{bmatrix} \right)$$

$$= \begin{bmatrix} \phi(a+e) & \phi(b+f) \\ \phi(c+g) & \phi(d+h) \end{bmatrix}$$

$$= \begin{bmatrix} \phi(a) + \phi(e) & \phi(b) + \phi(f) \\ \phi(c) + \phi(g) & \phi(d) + \phi(h) \end{bmatrix}$$

$$= \begin{bmatrix} \phi(a) & \phi(b) \\ \phi(c) & \phi(d) \end{bmatrix} + \begin{bmatrix} \phi(e) & \phi(f) \\ \phi(g) & \phi(h) \end{bmatrix}$$

$$= (M_{2}(\phi)) \begin{bmatrix} a & b \\ c & d \end{bmatrix} + (M_{2}(\phi)) \begin{bmatrix} e & f \\ g & h \end{bmatrix}$$

$$(M_{2}(\phi)) \begin{pmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} e & f \\ g & h \end{bmatrix} \end{pmatrix}$$

$$= (M_{2}(\phi)) \begin{pmatrix} \begin{bmatrix} ae + bg & af + bh \\ ce + dg & cf + dh \end{bmatrix} \end{pmatrix}$$

$$= \begin{bmatrix} \phi(ae + bg) & \phi(af + bh) \\ \phi(ce + dg) & \phi(cf + dh) \end{bmatrix}$$

$$= \begin{bmatrix} \phi(a)\phi(e) + \phi(b)\phi(g) & \phi(a)\phi(f) + \phi(b)\phi(h) \\ \phi(c)\phi(e) + \phi(d)\phi(g) & \phi(c)\phi(f) + \phi(d)\phi(h) \end{bmatrix}$$

$$= \begin{bmatrix} \phi(a) & \phi(b) \\ \phi(c) & \phi(d) \end{bmatrix} \begin{bmatrix} \phi(e) & \phi(f) \\ \phi(g) & \phi(h) \end{bmatrix}$$

$$= (M_{2}(\phi)) \begin{pmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix} \end{pmatrix} (M_{2}(\phi)) \begin{pmatrix} \begin{bmatrix} e & f \\ g & h \end{bmatrix} \end{pmatrix}$$

Therefore,  $M_2(\phi)$  is indeed a ring homomorphism.

- For any ring R and the identity function  $\mathrm{Id}_R$ ,  $M_2(\mathrm{Id}_R)$  is the identity map on  $M_2(R)$  because it maps each element in a given matrix to itself.
- Let  $f \in \text{Hom}(A, B), g \in \text{Hom}(B, C)$ .

$$(M_{2}(f \circ g)) \begin{pmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix} \end{pmatrix} = \begin{bmatrix} (f \circ g)(a) & (f \circ g)(b) \\ (f \circ g)(c) & (f \circ g)(d) \end{bmatrix}$$

$$= \begin{bmatrix} f(g(a)) & f(g(b)) \\ f(g(c)) & f(g(d)) \end{bmatrix}$$

$$= M_{2}(f) \begin{pmatrix} \begin{bmatrix} g(a) & g(b) \\ g(c) & g(d) \end{bmatrix} \end{pmatrix}$$

$$= M_{2}(f) \begin{pmatrix} M_{2}(g) \begin{pmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix} \end{pmatrix} \end{pmatrix}$$

$$= (M_{2}(f) \circ M_{2}(g)) \begin{pmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix} \end{pmatrix}.$$

Therefore,  $M_2$  is indeed a functor.

**Exercise.** (Problem 8 from More exercises) Consider the subgroup,  $D_5 = \langle (12345), (14)(23) \rangle \subset S_5$ .

- (1) Set a = (12345) and compute  $a^{-1}$ .
- (2) Set b = (14)(23) and compute  $aba^{-1}$ .
- (3) Show that every element in  $D_5$  may be written in the form  $a^i b^j$  for some  $i, j \in \mathbb{Z}$ .
- (4) Compute  $|D_5|$ .

Proof.

- (1)  $a \text{ sends } 1 \text{ to } 2, 2 \text{ to } 3, \cdots$ . We want  $a^{-1}$  to do the opposite. Thus  $a^{-1} = (15432)$ . Since (12345)(15432) = (15432)(12345) = (1), (15432) is indeed  $a^{-1}$ .
- (2)  $aba^{-1} = (a(1)a(4))(a(2)a(3)) = (25)(34).$
- (3) ba = (14)(23)(12345) = (13)(45), and  $a^{-1}b = (15432)(14)(23) = (13)(45)$ . Therefore,  $ba = a^{-1}b$ . We claim that  $ba^n = a^{-n}b$  for every  $n \in \mathbb{N}$ . Suppose  $ba^n = a^{-n}b$  for some  $n \in \mathbb{N}$ . Then  $ba^{n+1} = (ba^n)a = (a^{-n}b)a = a^{-n}(ba) = a^{-n}a^{-1}b = a^{-n-1}b$ . By mathematical induction,  $ba^n = a^{-n}b$  for every  $n \in \mathbb{N}$ .

For any  $n \in \mathbb{N}$ ,  $ba^n = a^{-n}b$ , so  $a^nba^n = b$ , and thus  $a^nb = ba^{-n}$ . Therefore, we have  $ba^k = a^{-k}b$  for every  $k \in \mathbb{Z}$ .

We claim that for any  $i, j \in \mathbb{Z}$ ,  $b^j a^i$  can be written in the desired form. Since  $b^2 = e$ , we consider two cases based on the parity of j. If j is even, then  $b^j = e$ , so  $b^j a^i = a^i$ . If j is odd, then  $b^j = b$ , so  $b^j a^i = ba^i = a^{-i}b$  as shown above.

We will prove the general case. By the argument above, it suffices to show that every element in  $D_5$  can be represented as a word of length  $\leq 2$ . Let  $x_1^{i_1} \cdots x_k^{i_k} \in D_5$  be given where  $i_1, \dots, i_k \in \mathbb{Z}$  and each  $x_i$  is either a or b. Since  $D_5$  is generated by a, b, every element can be represented in this form. We will show that every element in  $D_5$  can be represented as a word of length  $\leq 2$  by using strong induction. If  $k \leq 2$ , then we are done. Suppose that we can represent every element in  $D_5$  of length  $\leq k$  as a word of length  $\leq 2$  for some  $k \geq 2$ . Let  $x = x_1^{i_1} \cdots x_{k+1}^{i_{k+1}} \in D_5$ . If  $x_1 = x_2$ , then  $x = x_2^{i_1+i_2} x_3^{i_3} \cdots x_{k+1}^{i_{k+1}}$ , so by the inductive hypothesis, this can be represented as a word of length  $\leq 2$ . If  $x_2 = x_3$ , then  $x = x_1^{i_1} x_2^{i_2+i_3} x_4^{i_4} \cdots x_{k+1}^{i_{k+1}}$ , so by the inductive hypothesis, this can be represented as a word of length  $\leq 2$ . Suppose  $x_1 \neq x_2$  and  $x_2 \neq x_3$ . Then there are two cases:

- Case 1:  $(x_1, x_2, x_3) = (a, b, a)$ . By the argument above,  $b^{i_2}a^{i_3}$  can be represented as  $a^ib^j$  for some  $i, j \in \mathbb{Z}$ . Therefore,  $a^{i_1}(b^{i_2}a^{i_3}) = a^{i_1}(a^ib^j) = a^{i_1+i}b^j$ , so x can be represented as a word of length k. By the inductive hypothesis, x can be represented as a word of length  $\leq 2$ .
- Case 2:  $(x_1, x_2, x_3) = (b, a, b)$ . By the argument above,  $b^{i_1}a^{i_2}$  can be represented as  $a^ib^j$  for some  $i, j \in \mathbb{Z}$ . Therefore,  $(b^{i_1}a^{i_2})b^{i_3} = (a^ib^j)b^{i_3} = a^ib^{j+i_3}$ . By the inductive hypothesis, x can be represented as a word of length  $\leq 2$ .
- (4)  $a^1 = a \neq (1)$ .
  - $a^2 = (13524) \neq (1)$ .

- $a^3 = (14253) \neq (1)$ .
- $a^4 = (15432) \neq (1)$ .
- $a^5 = (1)$ .

Therefore, the order of a is 5. Since  $b \neq (1)$  and  $b^2 = (1)$ , the order of b is 2. We claim that there are exactly 10 elements in  $D_5$ .

- Claim 1:  $|D_5| \leq 10$ . Let  $x \in D_5$ . Then there exist  $i, j \in \mathbb{Z}$  such that  $x = a^i b^j$ . Since the order of a is 5 and the order of b is 2, we can assume that  $0 \leq i \leq 4$  and  $0 \leq j \leq 1$ . Therefore,  $D_5 \subset \{a^i b^j \mid 0 \leq i \leq 4, 0 \leq j \leq 1\}$ . Thus there are at most 10 elements in  $D_5$ .
- Claim 2:  $|D_5| \leq 10$ . Let  $a^ib^j, a^{i'}b^{j'} \in \{a^ib^j \mid 0 \leq i \leq 4, 0 \leq j \leq 1\}$ . Suppose  $a^ib^j = a^{i'}b^{j'}$ . Then  $a^{i-i'} = b^{j'-j}$ . We have calculated all the powers of a above, and none of them is equal to b. Therefore,  $i i' \equiv 0 \pmod{5}$  and  $j j' \equiv 0 \pmod{2}$ . Since  $0 \leq i, i' \leq 4, 0 \leq j, j' \leq 1, i = i'$  and j = j'. This implies that the set  $\{a^ib^j \mid 0 \leq i \leq 4, 0 \leq j \leq 1\}$  contains exactly 10 elements. Since the set is a subset of  $D_5, D_5$  contains at least 10 elements.

Therefore,  $D_5$  contains exactly 10 elements.

(5) a corresponds to a reflection, and b corresponds to a rotation as in the figure.
