1. Field Extension 1

#### 1. FIELD EXTENSION

**Exercise.** (Problem 1) Let p be a prime number. Let  $K = \mathbb{Z}/p\mathbb{Z}(t)$  be the fraction field of  $\mathbb{Z}/p\mathbb{Z}[t]$ .

- (i) What is the characteristic of K?
- (ii) What is the characteristic of any extension field of K?
- (iii) Show that the Frobenius endormophism,  $F: K \to K$  is not a ring isomorphism.
- (iv) Let  $f(x) = x^p t \in K[x]$ . Prove that f(x) is irreducible.
- (v) Prove that f(x) is not a separable polynomial.
- (vi) Construct an explicit field extension  $K \subset L$  such that  $f(x) \in L[x]$  has a factor of positive degree < p.
- (vii) With f and L above find all the roots of f(x) in L and determine their multiplicaties.

## Proof.

(i) We will prove in general that if  $R \subset S$  are both commutative rings with 1, they have the same characteristic. Let  $i: R \to S$  be the inclusion map. Let  $\phi: \mathbb{Z} \to R$  be the unique ring homomorphism.

Then  $i \circ \phi : \mathbb{Z} \to S$  is a ring homomorphism, and this is the only homomorphism from  $\mathbb{Z}$  to S by the uniqueness.

$$a \in \ker(\phi) \iff \phi(a) = 0$$
  
 $\iff i(\phi(a)) = 0$  (*i* is injective)  
 $\iff a \in \ker(i \circ \phi).$ 

Thus  $\ker(\phi) = \ker(i \circ \phi)$ , so R and S have the same characteristic.

Therefore,  $\mathbb{Z}/p\mathbb{Z}$  has the same characteristic as K. The kernel of  $\psi : \mathbb{Z} \to \mathbb{Z}/p\mathbb{Z}$  is (p), so the characteristic of K is p.

(ii) Using the result that we proved in (i), we conclude that the characteristic of any extension field of K is p.

(iii) Suppose that it is a ring isomorphism. Let  $a/b \in K$  be chosen such that F(a/b) = t.

$$\left(\frac{a}{b}\right)^p = t \implies a^p = tb^p$$

$$\implies p \deg(a) = \deg(t) + p \deg(b)$$

$$\implies p(\deg(a) - \deg(b)) = 1.$$

However,  $p \ge 2$ , so this is impossible. Therefore, F is not a ring isomorphism.

I don't know how to solve this. I tried using the ideas in the proof of Lemma 6.5(i), but I got stuck. The idea is that if f is irreducible, K[x]/(f) is a field. Then consider  $F:K[x]/(f)\to K[x]/(f)$ . Then we have  $\ker(\operatorname{Id}-F)=\{g+(f)\mid (\operatorname{Id}-F)(g+(f))=0\}=\{g+(f)\mid g+(f)=F(g+(f))\}$ . But I'm not sure what this tells us.  $t+(f)\notin \ker(\operatorname{Id}-F)$ , but I don't know what to do with it. I wonder if this has anything to do with nilpotent elements? What happens if I take something like  $(t+(f))^p$ ? A field can't have nilpotent elements.

**Exercise.** (Problem 2) Let F be a field of characteristic 0. Let  $f(x) \in F[x]$  be an irreducible polynomial. Then f(x) is separable.

Proof. Let  $f(x) = \sum_{i=0}^{n} a_i x^i \in F[x]$  be an irreducible polynomial with  $a_n \neq 0$ . Since f(x) is irreducible, f(x) is neither a unit nor 0. Since F is a field, all polynomials of degree 0 are units. Thus  $\deg(f(x)) = n \geq 1$ . It suffices to show that  $\operatorname{GCD}(f(x), f'(x)) = F^*$  by Lemma 3.2. Let  $g(x) \in F[x]$  be given such that  $g(x) \mid f(x), g(x) \mid f'(x)$ . Since f(x) is irreducible, either g(x) is a unit or there exists a unit  $u \in F^*$  such that g(x) = uf(x). Suppose g(x) is not a unit. Since  $g(x) \mid f'(x), f'(x) = h(x)g(x) = uh(x)f(x)$  for some  $h(x) \in F[x]$ . Thus  $\deg(f'(x)) = \deg(uh(x)) + \deg(f(x))$ .

- $f'(x) = \sum_{i=1}^{n} i a_i x^{i-1}, n \ge 1$  and  $a_n \ne 0$ . Since F is a field of characteristic  $0, na_n \ne 0$ . Therefore,  $\deg(f'(x)) = n 1$ .
- $\deg(uh(x)) \ge 0$ .
- $\deg(f(x)) = n$ .

(iv)

However, this implies that  $n-1 \ge 0+n=n$ . This is a contradiction, so g(x) must be a unit. Therefore,  $GCD(f(x), f'(x)) = F^*$ .

**Exercise.** (Problem 3) Let F be a field. Let  $f(x) \in F[x]$  be an irreducible polynomial which is not separable. Show that  $f'(x) = 0 \in F[x]$ .

*Proof.* Suppose f(x) is irreducible. Then  $f(x) \neq 0$  and f(x) is not a unit by definition. Thus  $\deg(f(x)) \geq 1$ .

Since f(x) is not separable, there exists a non-unit  $g(x) \in F[x]$  such that  $g(x) \mid f(x)$  and  $g(x) \mid f'(x)$  by Lemma 3.2 from the Field Extension handout. Since f(x) is irreducible and g(x) is not a unit, f(x) is the product of g(x) and a unit. This implies that  $\deg(f(x)) = \deg(g(x))$ .

Since  $g(x) \mid f'(x), f'(x) = h(x)g(x)$ . If f'(x) = 0, we are done. Suppose otherwise. Then  $\deg(f'(x)) = \deg(h(x)) + \deg(g(x)) = \deg(h(x)) + \deg(f(x)) \geq \deg(f(x))$ . However, by the definition of the ' operator,  $\deg(f'(x)) < \deg(f(x))$ . This is a contradiction, so f'(x) = 0.  $\square$ 

**Exercise.** (Problem 4) Let F be a field of prime characteristic p. Let  $f(x) = \sum_{i=0}^{n} a_i x^i \in F[x]$  be an irreducible polynomial. Give a necessary and sufficient criterion for f(x) to be inseparable in terms of the coefficients  $a_i$ .

*Proof.* We claim that  $\forall i, (i \notin p\mathbb{Z} \implies a_i = 0)$  is a necessary and sufficient criterion.

- Suppose f(x) is inseparable. By Lemma 5.5 from the Field Extension handout, f'(x) = 0. If f'(x) = 0, then  $ia_i = 0$  for each i. Since p is a prime,  $a_i$  must be 0 if  $i \notin p\mathbb{Z}$ .
- Suppose  $\forall i, (i \notin p\mathbb{Z} \implies a_i = 0)$ . Then f'(x) = 0, so  $f(x) \mid f(x), f(x) \mid f'(x)$  and f(x) is not a unit since f(x) is irreducible. Therefore,  $GCD(f(x), f'(x)) \neq F^{\times}$ , so f is inseparable by Lemma 3.2.

Hence,  $\forall i, (i \notin p\mathbb{Z} \implies a_i = 0)$  is a necessary and sufficient criterion.

**Exercise.** (Problem 5) What is the characteristic of the ring  $\mathbb{Z} \times \mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/10\mathbb{Z}$ ?

*Proof.* Define  $\phi : \mathbb{Z} \to \mathbb{Z} \times \mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/10\mathbb{Z}$  such that  $\phi(k) = (k, 0, 0)$ . Then  $\phi$  is injective, so the characteristic is 0.

**Exercise.** (Problem 6) Let K be a finite field of characteristic p. Let  $a, b \in K^*$  be two elements which have the same order in this finite group. Show that  $\mathbb{Z}/p[a] = \mathbb{Z}/p[b]$  as subfields of K.

Can I just say they both have the same number of elements and use the lemma from *Proof.*
