### 1. Rings of Fractions

**Exercise.** (Problem 3) Let  $T \subset R$  be the subset consisting of all non zero divisors.

- $\bullet$  Show that T is a multiplicative set.
- Let  $s \in T$  and let  $S = \{1, s, s^2, s^3, \dots\} \subset T$ . Show that the following rings are isomorphic:  $S^{-1}R$ , the subring  $R[1/s] \subset T^{-1}R$ , and the quotient ring R[x]/(sx-1).

## Proof.

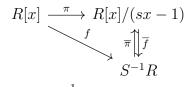

- Let  $a, b \in T$ . Let  $c \in R$  be given. If (ab)c = 0, then a(bc) = 0. Since a is a non zero divisor, bc = 0. Since b is a non zero divisor, c = 0. Since b is a commutative ring throughout this handout, there is no need to check the case that c(ab) = 0. Thus ab is a non zero divisor, so T is closed under multiplication.
  - $-1 \in T \text{ since } \forall c \in R, c \cdot 1 = 0 \implies c = 0.$

Therefore, T is indeed a multiplicative set.

- $S^{-1}R$  and R[1/s] are isomorphic because:
  - They are the same set. They both contain all equivalence classes [(r,s)] for  $r \in R$  and  $s \in S$  with the same equivalence relation.
  - They have the same addition and multiplication.

Let  $\pi$  be the canonical map from R[x] into R[x]/(sx-1). Let  $f:R[x]\to S^{-1}R$  be the homomorphism associated to the inclusion map  $R\to S^{-1}R$  and the element  $1/s\in S^{-1}R$ . By the mapping property of polynomials, the existence of f is guaranteed.

By the universal property of the quotient, universal mapping property of the ring of fractions, there exist homomorphisms  $\overline{f}, \overline{\pi}$ , respectively, such that the following diagram commutes:

Since  $\pi$  and f are both surjective,  $\overline{f}$  and  $\overline{\pi}$  must be surjective in order for the diagram to commute. Then  $\overline{f} \circ \overline{\pi} \circ f = \overline{f} \circ \pi = f$ . Since f is surjective, this implies that  $\overline{f} \circ \overline{\pi} = \operatorname{Id}_{S^{-1}R}$ . Similarly,  $\overline{\pi} \circ \overline{f} = \operatorname{Id}_{R[x]/(sx-1)}$ . Therefore,  $\overline{\pi}$  and  $\overline{f}$  are the inverse homomorphism of each other, so they are isomorphisms.

### 2. Modules

**Exercise.** (Problem 1) For each of the  $\mathbb{Z}$ -modules listed in the handout, answer the questions in the handout.

## Proof.

- (a)  $M = \mathbb{Z}^3 \times \mathbb{Z}/86\mathbb{Z}$ .
  - (i) M is finitely generated.
  - (ii) M is finitely presented.
  - (iii) 4.
  - (iv) Yes.
  - (v) Yes.
  - (vi) No.
- (b)  $M = \prod_{n>1} \mathbb{Z}/n\mathbb{Z}$ .
  - (i) M is not finitely generated.
  - (ii) M is not finitely presented.
  - (iii) Infinite.
  - (iv) No.
  - (v) No.
  - (vi) Yes.
- (c)  $M = \mathbb{Z}[1/p] \subset \mathbb{Q}$ .
  - (i) M is not finitely generated.
  - (ii) M is not finitely presented.
  - (iii) 1.
  - (iv) No.
  - (v) No.
  - (vi) No.
- (d)  $M = \mathbb{Q}/\mathbb{Z}_{(p)}$ .
  - (i) M is not finitely generated.
  - (ii) M is not finitely presented.
  - (iii) 1.
  - (iv) No.
  - (v) No.
  - (vi) Yes.

## 3. The Quadratic Equation

**Exercise.** (Problem 20) Construct ring isomorphisms  $\mathbb{Z}[x]/(x^2-2) \to \mathbb{Z}[\sqrt{2}]$  and  $\mathbb{Z}/(p)[x]/(x^2-2) \to \mathbb{Z}[\sqrt{2}]/(p)$ .

2

*Proof.* Let  $i: \mathbb{Z} \to \mathbb{Z}[\sqrt{2}]$  be the inclusion and  $s = \sqrt{2} \in \mathbb{Z}[\sqrt{2}]$ . By the mapping property of polynomials, there exists a ring homomorphism  $\phi: \mathbb{Z}[x] \to \mathbb{Z}[\sqrt{2}]$  such that  $\phi(\sum_{i=0}^n r_i x^i) = \sum_{i=0}^n i(r_i)s^i$ . In other words,  $\phi$  maps f(x) into  $f(\sqrt{2})$ . For each  $a+b\sqrt{2} \in \mathbb{Z}[\sqrt{2}]$ ,  $\phi(a+bx) = a+b\sqrt{2}$ , so  $\phi$  is surjective. We claim that  $\ker(\phi) = (x^2-2)$ .

- Since  $\sqrt{2}^2 2 = 2 2 = 0$ ,  $x^2 2 \in \ker(\phi)$ . Moreover,  $(x^2 2) \subset \ker(\phi)$ .
- Let  $f(x) \in \ker(\phi)$ . Since  $\mathbb{Z}[x]$  is a Euclidean domain,  $f(x) = q(x)(x^2 2) + ax + b$  for some  $q(x) \in \mathbb{Z}[x]$ ,  $a, b \in \mathbb{Z}$ . Since  $ax + b = f(x) q(x)(x^2 2)$ ,  $a\sqrt{2} + b = 0$ . Since a, b are integers, a = b = 0. This implies  $f(x) \in (x^2 2)$ .

Therefore,  $\ker(\phi) = (x^2 - 2)$ . By the first isomorphism theorem (Theorem 16 on P.97, Dummit and Foote),  $\tilde{\phi} : \mathbb{Z}[x]/(x^2 - 2) \to \mathbb{Z}[\sqrt{2}]$  induced by  $\phi$  is an isomorphism.

We will solve the second part using the same approach. We will assume that p is a prime. Consider the inclusion  $\mathbb{Z}/(p) \hookrightarrow \mathbb{Z}[\sqrt{2}]/(p)$  and the element  $\sqrt{2} + (p) \in \mathbb{Z}[\sqrt{2}]/(p)$ . Let  $\Phi: \mathbb{Z}/(p)[x] \to \mathbb{Z}[\sqrt{2}]/(p)$  be a ring homomorphism associated to the inclusion and element. We will examine how  $\Phi$  behaves.

$$\Phi(\sum_{i=0}^{n} (a_i + (p))x^i) = \sum_{i=0}^{n} (a_i + (p))(\sqrt{2} + (p))^i$$

$$= \sum_{i=0}^{n} (a_i + (p))(\sqrt{2}^i + (p))$$

$$= \sum_{i=0}^{n} (a_i \sqrt{2}^i + (p))$$

$$= (\sum_{i=0}^{n} a_i \sqrt{2}^i) + (p).$$

For any  $a + b\sqrt{2} + (p) \in \mathbb{Z}[\sqrt{2}]/(p)$ ,  $\Phi((a + (p)) + (b + (p))x) = a + b\sqrt{2} + (p)$ , so  $\Phi$  is surjective. We claim that  $\ker(\Phi) = (x^2 - 2)$ . Here, by  $x^2 - 2$ , we mean  $(1 + (p))x^2 - (2 + (p))$ .

- Since  $\sqrt{2}^2 2 = 0$ ,  $(x^2 2) \in \ker(\Phi)$ .
- Let  $f(x) \in \ker(\Phi) \subset \mathbb{Z}/(p)[x]$ . Since p is a prime,  $\mathbb{Z}/(p)$  is a field. Thus  $\mathbb{Z}/(p)[x]$  is a Euclidean domain. Choose  $q(x) \in \mathbb{Z}/(p)[x]$  and  $a + (p), b + (p) \in \mathbb{Z}/(p)$  such that  $f(x) = (x^2 2)q(x) + ((a + (p))x + (b + (p))$ . Then  $0 = \Phi(f(x)) = \Phi(x^2 2)\Phi(q(x)) + \Phi((a + (p))x + (b + (p))) = 0 + \Phi((a + (p))x + (b + (p)))$ . Thus  $\Phi((a + (p))x + (b + (p))) = (a + (p))(\sqrt{2} + (p)) + (b + (p)) = (a\sqrt{2} + b) + (p)$ . Therefore,  $a\sqrt{2} + b \in (p)$ . Since  $a, b \in \mathbb{Z}$ , this is possible only if a = 0 and  $b \in (p)$ . In other words, this is possible only if a + (p) = b + (p) = 0. Therefore,  $f(x) = (x^2 2)q(x) \in (x^2 2)$ .

Therefore,  $\ker(\Phi) = (x^2 - 2)$ , so the homomorphism  $\tilde{\Phi}$  induced by  $\Phi$  is an isomorphism from  $\mathbb{Z}/(p)[x]/(x^2 - 2) \to \mathbb{Z}[\sqrt{2}]/(p)$  by the first isomorphism theorem.

**Exercise.** (Problem 21) Let  $p \in \mathbb{Z}$  be an odd prime. Show that  $\mathbb{Z}[\sqrt{2}]/(p)$  is an integral domain if and only if  $(x^2 - 2)$  is an irreducible element of  $\mathbb{Z}/(p)[x]$ . Show that this occurs if and only if 2 is not a square in  $\mathbb{Z}/(p)$ .

*Proof.* By Problem 20,  $\mathbb{Z}[\sqrt{2}]/(p)$  is isomorphic to  $\mathbb{Z}/(p)[x]/(x^2-2)$ . Thus it suffices to show that  $\mathbb{Z}/(p)[x]/(x^2-2)$  is an integral domain if and only if  $x^2-2$  is an irreducible element

of  $\mathbb{Z}/(p)[x]$ . By Corollary 4 on P.300 (Dummit and Foote), since  $\mathbb{Z}/(p)$  is a field,  $\mathbb{Z}/(p)[x]$ is a UFD. By Proposition 12 on P.286, a nonzero element generates a prime ideal if and only if it is irreducible. By Proposition 13 on P.255,  $(x^2-2)$  is a prime ideal if and only if  $\mathbb{Z}/(p)[x]/(x^2-2)$  is an integral domain. Therefore,  $\mathbb{Z}/(p)[x]/(x^2-2)$  is an integral domain if and only if  $x^2 - 2$  is an irreducible element.

We will show that  $\mathbb{Z}[\sqrt{2}]/(p)$  is not an integral domain if and only if 2 is a square in  $\mathbb{Z}/(p)$ .

- For any  $a + (p) \in \mathbb{Z}/(p)$ ,  $(a + \sqrt{2} + (p))(a \sqrt{2} + (p)) = (a^2 2) + (p)$  in  $\mathbb{Z}[\sqrt{2}]/(p)$ . If  $(a+(p))^2 = 2+(p)$  for some  $a+(p) \in \mathbb{Z}/(p)$ , then  $(a+\sqrt{2}+(p))(a-\sqrt{2}+(p)) =$ (2-2)+(p)=0. Thus  $\mathbb{Z}[\sqrt{2}]/(p)$  is not an integral domain.
- Suppose that  $\mathbb{Z}[\sqrt{2}]/(p)$  is not an integral domain. Then  $x^2-2$  is not irreducible. Since the degree of  $x^2-2$  is 2 and every nonzero constant polynomial in  $\mathbb{Z}/(p)[x]$ is a unit,  $x^2 - 2$  must have a factor of degree 1. Choose  $a, b \in \mathbb{Z}/(p)$  such that  $(x+a)(x+b) = x^2 - 2$ . We can assume that the leading coefficients of the factors are 1 because  $\mathbb{Z}/(p)$  is a field. This implies  $x^2 + (a+b)x + ab = x^2 - 2$ . Thus a+b=0, so b = -a. This implies  $x^2 - 2 = (x + a)(x - a)$ , so  $-2 = -a^2$ . Thus  $a^2 = 2$ , so 2 is a square in  $\mathbb{Z}/(p)$ .

Therefore,  $\mathbb{Z}[\sqrt{2}]/(p)$  is an integral domain if and only if 2 is not a square in  $\mathbb{Z}/(p)$ .

Exercise. (Problem 22) Use your answers to 21 and 19 to determine for which of the following values of p,  $x^2 - 2y^2 = p$  has a solution: p = 3, 5, 7, 11, 13, 17.

*Proof.* By Problem 19,  $x^2 - 2y^2 = p$  has a solution if and only if p is irreducible in  $\mathbb{Z}[\sqrt{2}]$ . Since  $\mathbb{Z}[\sqrt{2}]$  is a UFD by Problem 14, by Proposition 12 on P.286, p generates a prime ideal if and only if p is irreducible. By Proposition 13 on P.255, (p) is a prime ideal if and only if  $\mathbb{Z}[\sqrt{2}]/(p)$  is an integral domain. By Problem 21, 2 is not a square in  $\mathbb{Z}/(p)$  if and only if  $\mathbb{Z}[\sqrt{2}]/(p)$  is an integral domain.

Therefore,  $x^2 - 2y^2 = p$  has a solution if and only if 2 is not a square in  $\mathbb{Z}/(p)$ .

- (Modulo 3)  $2^2 \equiv 1$ .
- (Modulo 5)  $2^2 \equiv 4, 3^2 \equiv 4, 4^2 \equiv 1.$
- (Modulo 7)  $2^2 \equiv 4, 3^2 \equiv 2$ .
- (Modulo 11)  $2^2 \equiv 4, 3^2 \equiv 9, 4^2 \equiv 5, 5^2 \equiv 3, 6^2 \equiv 3, 7^2 \equiv 5, 8^2 \equiv 9, 9^2 \equiv 4, 10^2 \equiv 1.$
- (Modulo 13)  $2^2 \equiv 4, 3^2 \equiv 9, 4^2 \equiv 3, 5^2 \equiv 12, 6^2 \equiv 10, 7^2 \equiv 10, 8^2 \equiv 12, 9^2 \equiv 3, 10^2 \equiv 10, 10^2 \equiv$  $9,11^2 \equiv 4,12^2 \equiv 1.$
- (Modulo 17)  $2^2 \equiv 4, 3^2 \equiv 9, 4^2 \equiv 16, 5^2 \equiv 8, 6^2 \equiv 2$ .

Therefore,  $x^2 - 2y^2 = p$  has a solution if p = 7, 17 and it doesn't if p = 3, 5, 11, 13. 

### 4. Factorization in Integral Domains

Exercise. (Problem 5)

- Let k be a field and let  $a \in k$ . Construct a k-algebra isomorphism,  $k[x,y]/(x-a) \to k$ k[y]. Justify your answer.
- Let  $f(x,y) \in k[x,y]$ . What is the image of f(x,y) under the above isomorphism?

Proof.

• Let  $\phi$  be defined such that  $\phi(f(x,y) + (x-a)) = f(a,y)$ .

– Well-defined? Let f(x,y) + (x-a) = g(x,y) + (x-a). Then g(x,y) = f(x,y) + h(x,y)(x-a).

$$\phi(g(x,y) + (x - a)) = \phi((f(x,y) + h(x,y)(x - a)) + (x - a))$$

$$= f(a,y) + h(a,y)(a - a)$$

$$= f(a,y)$$

$$= \phi(f(x,y)).$$

-k-algebra homomorphism? Let  $c \in k, f, g \in k[x, y]$  be given.

$$\phi(c(f + (x - a))) = \phi(cf + (x - a))$$

$$= cf(a, y)$$

$$= c\phi(f + (x - a)).$$

$$\phi((f + g) + (x - a)) = (f + g)(a, y)$$

$$= f(a, y) + g(a, y)$$

$$= \phi(f + (x - a)) + \phi(g + (x - a)).$$

$$\phi((fg) + (x - a)) = (fg)(a, y)$$

$$= f(a, y)g(a, y)$$

$$= \phi(f + (x - a))\phi(g + (x - a)).$$

•  $\phi(f(x,y) + (x-a)) = f(a,y)$ .

## Exercise. (Problem 6)

• Give an example of a field k, an element  $a \in k$  and a reducible polynomial  $f(x, y) \in k[x, y]$  of degree n in y such that  $f(a, y) \in k[y]$  is irreducible and has degree n.

- Suppose given a polynomial  $f \in k[x,y]$  which when viewed as an element of k(x)[y] has degree n (in y) and content 1. Suppose there is some  $a \in k$  such that  $f(a,y) \in k[y]$  is irreducible and has degree n. Show that  $f(x,y) \in k[x,y]$  is irreducible.
- Give an example of a field k, an element,  $a \in k$ , and a reducible polynomial  $f(x,y) \in k[x,y]$ , which when viewed as an element of k(x)[y] has degree n and content 1 such that  $f(a,y) \in k[y]$  is irreducible.

### Proof.

- Let  $k = \mathbb{Q}$ , a = 1, f(x, y) = xy. Then the degree of f(x, y) in y is 1.  $f(x, y) = xy \in k[x, y]$  is reducible since x and y are not units in k[x, y]. However, f(a, y) = 1y = y is irreducible in k[y].
- Choose  $f_1, \dots, f_n \in k[x]$  such that  $f(x,y) = f_n(x)y^n + \dots + f_1(x)y^1 + f_0(x)$ . Then  $f(a,y) = f_n(a)y^n + \dots + f_1(a)y^1 + f_0(a)$ . Let  $h_1(x,y), h_2(x,y) \in k[x]$  be given such that  $f(x,y) = h_1(x,y)h_2(x,y)$ . Then  $f(a,y) = h_1(a,y)h_2(a,y)$ . Then  $h_1(a,y)$  or  $h_2(a,y)$  is a unit in k[y] since f(a,y) is irreducible in k[y]. Without loss of generality, we will assume  $h_1(a,y)$  is a unit in k[y].

It is given that  $\deg_y(f(a,y))$ , the degree of f(a,y) in y, is n. Thus  $\deg_y(h_1(a,y)) + \deg_y(h_2(a,y)) = n$ . Since  $\deg_y(h_1(a,y)) = 0$ ,  $\deg_y(h_2(a,y)) = n$ . Therefore,  $\deg_y(h_2(x,y)) \geq n$ .

On the other hand,  $\deg_y(f(x,y)) = \deg_y(h_1(x,y)) + \deg_y(h_2(x,y))$ , so  $\deg_y(h_2(x,y)) \le n$ . Thus  $\deg_y(h_2(x,y)) = n$ . Let  $g_1(x), \dots, g_n(x) \in k[x]$  such that  $h_2(x,y) = g_n(x)y^n + \dots + g_1(x)y^1 + g_0(x)$ . Then  $f(x,y) = h_1(x,y)h_2(x,y) = (h_1(x,y)g_n(x))y^n + \dots + (h_1(x,y)g_1(x))y^1 + h_1(x,y)g_0(x)$ .

Since  $\deg_y(h_2(x,y)) = n$ ,  $\deg_y(h_1(x,y)) = 0$ . Thus,  $h_1(x,y) \in k[x]$ , so  $h_1(x,y)g_i(x) \in k[x]$  for each i. Therefore,  $h_1(x,y)g_i(x) = f_i(x)$  for each i.

Let  $p \in k[x]$  be an irreducible. If  $p \mid h_1(x,y)$ , then  $p \mid f_i(x) = h_1(x,y)g_i(x)$  for each i, so  $\operatorname{ord}_p(f_i) \geq 1$  for each i. Therefore,  $o_p(f(x,y)) \geq 1$ , and thus  $p \mid \operatorname{cont}(f(x,y))$ . However, since  $\operatorname{cont}(f(x,y)) = 1$ ,  $p \nmid h_1(x,y)$ . Thus  $h_1(x,y)$  is a unit in k[x] since it cannot be divided by any irreducibles. Since  $h_1(x,y)$  is a unit in k[x] and k[y], it must consist only of a constant term, which is a unit in k. Hence,  $h_1(x,y)$  is a unit in k[x,y].

We have shown that for any  $h_1(x, y), h_2(x, y) \in k[x, y], h_1h_2 = f$  implies one of  $h_1$  or  $h_2$  is a unit. Therefore, f(x, y) is an irreducible in k[x, y].

- Let  $k = \mathbb{Q}$ , a = 1,  $f(x, y) = (x 1)y^2 + y$ . Then f(x, y), which when viewed as an element of k(x)[y] has degree 1.
  - The coefficient of y is 1, and  $\operatorname{ord}_p(1) = 0$  for any p because  $1 \in k[x]^*$ .
  - The coefficient of  $y^2$ , when f(x,y) is viewed as an element of k(x)[y] is x-1. Thus for any irreducible element  $p \in k[x]$ ,  $\operatorname{ord}_p(x-1) \geq 0$ .

Therefore,  $o_p(f(x)) = 0$  for any irreducible element  $p \in k[x]$ . Thus cont(f(x,y)) = 1.  $f(a,y) = y \in k[y]$ . This is irreducible because if  $f_1 f_2 = y$  for some  $f_1, f_2 \in k[y]$ , then  $\deg(f_1) + \deg(f_2) = 1$  implies that one of  $f_1$  or  $f_2$  is a unit in k.

6
